

## Introducing Foodie Alerts

Savor can now notify you when you're near that restaurant you've been wanting to try, or when an exceptional version of a favorite dish or drink is at hand.

If you're like us, you probably have a list of restaurants, clubs, pubs, cafés, coffee shops, pizzerias, sushi bars, tearooms, or taverns you want to check out. Or you're always on the lookout for the best fish taco, French onion soup, or Old Fashioned wherever you go. Wouldn't it be great if someone kept track of all this for you and tapped you on the shoulder when your next great dining experience was close by?

Introducing Foodie Alerts, personalized proximity notifications that let you know when that place-you-said-you-wanted-to-try-next-time-you-visited-that-certain-city is around the corner. Or, when you're in the vicinity of a favorite food or beverage done right.

This is not random advertising. These are subtle alerts about specific venues explicitly requested by you, and menu items based on organic feedback from other foodies. So, you're always in control.

Savor's proprietary proximity notification logic uses sophisticated energy-saving algorithms that minimize battery consumption. (Field tests showed no significant change in power consumption from the previous version of Savor.)

To learn more about Foodie Alerts, go to More > FAQ > What's a Foodie Alert? in the [Savor iPhone app](#).

Also included in the Savor 1.2 update are the following enhancements:

- "Shake to Search" – Shaking your phone, with Savor running in the foreground, will instantly notify you of any nearby favorites.
- The Place Info page now includes a link to the place's mobile menu. (If they offer one.)
- Tapping an item in your Favorites Items list displays all posts for that item sorted by average rating. (Kind of interesting if you're looking for the "best of" something on a global scale.)
- Some bug fixes and additional optimizations.

*Share what you savor.  
Because friends don't let friends order badly.*
